

Amendments to the Abstract:

Please replace the abstract on page 13, lines 1 to 13, with the following rewritten abstract:

A connector has an inner side face defining a chamber formed with an opening. A module body is inserted from the opening to be accommodated in the chamber. A first conductive member is provided on an outer periphery of the module body which is opposed to the inner side face of the connector in a case where the module body is accommodated in the chamber. A second conductive member is provided on the inner side face of the connector, such that the first conductive member is brought into contact with the ~~first~~ second conductive member in a case where the module body is plenarily accommodated in the chamber.
